

The Clemco remote control valve is a new development in abrasive control for sand-blasting systems. It provides the blaster with complete "on" and "off" control of both the air and abrasive supplies from his station at the nozzle.

In many instances it eliminates the necessity of having a tender at the machine—it provides maximum safety for blasters working in confined areas such as within tank cars or ships tanks, where the instantaneous and automatic shut off feature eliminates the necessity of depending on a tender outside the tank to shut the abrasive off or on.

Check with Clemco for additional information on this practical, money-saving control valve.
