

If you're planning on
air conditioning...

Here are six reasons for considering gas air conditioning:

1. Long life. Designed with a minimum of major moving parts, gas air conditioning units last longer, with little decrease in efficiency as they get older.

2. Low maintenance cost. Fewer moving parts in the cooling cycle means low maintenance cost for gas units.

3. Less noise and vibration. Gas systems are ideal for rooftop or other installations where building supports aren't strong enough to withstand heavy vibrations.

4. Efficient control. Gas units operate efficiently at any load level. They respond quickly to varying load levels, preventing a noticeable increase in room temperature when an empty room suddenly fills with people.

5. Makes use of present equipment. Some gas systems use the boilers of air cooling water heating systems for cooling, saving substantially on installation costs.

6. Low fuel cost. Some gas air conditioning systems use low cost, Natural Gas, if convenient, as well as efficient.

More and more buildings, new and remodeled, are being cooled by Natural Gas these days. What about yours? For more information, consult your architect, engineer or PG&E.
